Version 1.2

February 9, 2026

Version History

Version	Date	Changes	Author
0.1	2025-12-16	Initial protocol specification proposal	Raffael Rott
0.2	2025-12-16	Implemented Proposals from Team members	Raffael Rott
0.3	2026-01-05	Fixed final bugs before initial release	Raffael Rott
1.0	2026-01-11	Fixed minor typos.	Raffael Rott
1.1	2026-01-25	Fixed total sizes of structs.	Fabian Weichselbaum
1.2	2026-02-09	Fixed inconsistant field value lengths & typos	Raffael Rott

1 Purpose and Scope

The purpose of the LiquidCan protocol is to serve at the heart of all future liquids projects at the TU Wien Space Team. Building on the CAN FD standard, it defines how our client devices (such as ECUs) communicate with each other and the central server and with each other. It is designed to be as simple and extensible as possible. One of the design goals of this protocol is to minimize the amount of common type or field definitions between the server and the nodes.

2 Notation and Conventions

- This protocol uses the CAN-FD extension
- All fields are little endian.
- All strings are ASCII encoded and null terminated.
- Payload length: Variable depending on message type but up to 64 Bytes.

2.1 Common Terms

Term	Description
(CAN) Client	A CAN client is a device which is connected to the bus
Node	Every client which is not the server
TelemetryValue	A telemetryValue is a non-externally modifiable value which periodically gets sent to the server
Parameters	Parameters can be externally modified
Field	An encompassing term for telemetryValues and parameters
ECU	A commonly used embedded CAN device at the TU Wien Space Team

3 CAN Identifier Scheme & NodeID

Each device on the bus has its own unique Node ID. The Server is assigned the Node ID 0. The CAN ID is composed of 11 bits. It contains the sender and receiver Node IDs and a priority bit.

Note the location of the priority bit: It is set as the last bit here since this document expects little-endianness. On the actual bus the priority bit will be sent first, therefore ensuring that the packets are properly prioritised by the CAN Protocol.

Field	Bits	Description
Receiver	5	Destination node ID
Sender	5	Source node ID
Priority	1	Message priority (0=low, 1=high)
Total	11	Standard CAN ID

4 Common Frame Layout

The CAN data field consists of 64 bytes. The first byte of each message contains the message type. This simple format allows the protocol to be extended in the future by adding more message types. See Section 9 for a detailed description of message types and their numeric values.

Field	Bytes	Description
message_type	1	Type of message (see Message Types)
data	63	Payload data

5 Node Registration

As soon as a node comes online (or when it receives a `node_info_req`), it enters the registration phase. See Figure 1 for a graphical representation the whole registration procedure. Here it sends out a `node_info_announcement`. This announces the node to the bus and includes its name, number of telemetryValues and parameters, and its firmware version through the firmware and LiquidCan hashes (see 10.1). The central server registers the new node and waits for `field_registration` messages. From this point on the node is able to send/receive messages on the bus.

6 Field Registration & Management

Fields are the heart of the protocol. The term Field serves as a general term for both telemetryValues and parameters. TelemetryValues are periodically sent to the server and non-modifiable. They are meant to represent sensor data or other information which should be periodically logged. Parameters can be externally modified and locked. These are meant for configuration fields, modifiable by either the server or other nodes.

Figure 1: Node Registration and Field Registration Flow

6.1 Registration

TelemetryValues and parameters are dynamically defined over the bus.

After registration was initialized, a node sends out `field_registration` messages, one for each parameter/telemetryValue. The FieldRegistration includes a field ID, the datatype of the field, and a human-readable name. The name and field ID have to be unique per node. The first bit of paramter

field IDs is 0 and the first bit of telemetryValue field IDs is 1. From this point on, the server knows which fields the node has. The fieldID 0 is reserved to indicate an invalid fieldID. It must not be assigned to a field. FieldIDs must be assigned in a deterministic way. This ensures that named fields have the same fieldID between reboots.

Next, the node sends `telemetry_group_definition` messages. The node sends a group ID to identify the group and a list of field IDs. The order of the field IDs must be the same as the order of fields in future `telemetry_group_updates`. The node must ensure that the values of all of the defined telemetryValues can fit into a `TelemetryGroupUpdate`.

6.2 Regular Operation

6.2.1 Parameter Updates

During regular operation, each node sends `telemetry_group_update` messages at a defined interval. The order of values here must match the field id ordering of the corresponding `telemetry_group_definition`. The interval can vary between groups, allowing nodes to send telemetryValues at different intervals to, for example, reduce bus utilization.

6.2.2 Parameter Setting

Other bus members can send a `parameter_set_req` message, which includes the field ID of the parameter and the new value. Once the node receives the request, it attempts to set the internal parameter value and responds with a `parameter_set_confirmation` message containing a status code, the parameter ID, and the actual value. The status field indicates whether the operation was successful or provides an error code (see `ParameterSetStatus` enum in 10.8). The value field should contain the actual value read back from the parameter, not simply the value that was received in the request.

When a parameter is internally modified through some automated system, the updated value must be sent as a `parameter_set_confirmation` message to the server with a `NodeToNodeModification` status code.

6.2.3 Parameter Locking

A parameter can optionally be locked through a `parameter_set_lock_req` message. After a parameter has been locked, it cannot be modified by an external node. A parameter can only be unlocked by the locking node or the server. To lock a parameter, a node sends a `parameter_set_lock_req` with the fieldID and the locking status (0=unlocked, 1=locked). The receiving node responds with a `parameter_set_lock_confirmation`, confirming the sent fieldID and the locking status. The receiving node also sends a `parameter_set_lock_confirmation` to the server to update it on the locking status of the parameter.

6.2.4 Requesting Field Data

A field can be accessed through a `field_get_req` message, which contains the field ID. Nodes respond with a `field_get_res` message, containing the field ID and the value of the field.

6.2.5 Field name Lookup

The field name lookup covers the case where nodes need to access fields from other nodes. Since they don't receive the `field_registration` messages, they don't know the fieldIDs of the named fields they want to access. `field_id_lookup_req` messages contain the remote field name. The Node responds with a `field_id_lookup_res` message, containing the fieldID and the datatype of the field. A fieldID of 0 indicates that the field was not found.

7 Heartbeats

Heartbeats ensure that the system does not reach a state where it is still dangerous to physically handle but not accessible through CAN messages. The `heartbeat_req` message sent from the server contains a continuously increasing counter. The counter value is unique to each node. If a node does not receive `heartbeat_req` messages, it will default to a safe state. Similarly, the server takes note of any unresponsive nodes.

8 Status Messages

Nodes may send optional status messages to the server. Currently, the three status message types are: `info_status`, `warning_status`, and `error_status`, as defined in [section 9](#). Each message contains a null-terminated string with a status message.

9 Message Types

The following message types are defined in the protocol:

Enum	Message Type	Data Payload	Direction	Description
<i>Node Discovery and Information</i>				
0	node_info_req	No payload	Server → Node	Request node information
1	node_info_announcement	NodeInfoRes (10.1)	Node → Server	Response with node capabilities and identification
<i>Status Messages</i>				
10	info_status	Status (10.2)	Node → Server	Informational status message
11	warning_status	Status (10.2)	Node → Server	Warning status message
12	error_status	Status (10.2)	Node → Server	Error status message
<i>Field Registration</i>				
20	telemetryValue_registration	FieldRegistration (10.3)	Node → Server	Register a telemetryValue field
21	parameter_registration	FieldRegistration (10.3)	Node → Server	Register a parameter field
<i>Telemetry Group Management</i>				
30	telemetry_group_definition	TelemetryGroupDefinition (10.4)	Node → Server	Define a group of fields for batch updates
31	telemetry_group_update	TelemetryGroupUpdate (10.5)	Node → Server	Update values for a field group
<i>Parameter Management</i>				
50	parameter_set_req	ParameterSetReq (10.7)	Server/Node → Node	Request to set a parameter value
51	parameter_set_confirmation	ParameterSetConfirmation (10.9)	Node → Server/Node	Response with confirmed parameter value
52	parameter_set_lock_req	ParameterSetLock (10.14)	Server/Node → Node	Request to lock a parameter
53	parameter_set_lock_confirmation	ParameterSetLock (10.14)	Node → Server	Response confirming parameter lock
<i>Field Access</i>				
60	field_get_req	FieldGetReq (10.10)	Server/Node → Node	Request field value
61	field_get_res	FieldGetRes (10.11)	Node → Server/Node	Response with field value
62	field_id_lookup_req	FieldIDLookupReq (10.12)	Node → Node	Requests the fieldID of a field name
63	field_id_lookup_res	FieldIDLookupRes (10.13)	Node → Node	Response with field ID
<i>Heartbeat</i>				

Enum	Message Type	Data Payload	Direction	Description
40	heartbeat_req	HeartBeat (10.6)	Server → Node	Heartbeat request
41	heartbeat_res	HeartBeat (10.6)	Node → Server	Heartbeat response

10 Data Structures

10.1 NodeInfoRes

Response containing information about a node's capabilities.

Figure 2: NodeInfoRes byte layout (8 bytes per row)

Field Descriptions:

Field	Bytes	Description
tel_cnt	1	Number of telemetryValues on this node
par_cnt	1	Number of parameters on this node
firmware_hash	4	Hash of the firmware version
liquid_hash	4	Hash of the LiquidCan protocol version
device_name	53	Human-readable device name
Total	63	

```
1 typedef struct __attribute__((packed)) {
2     uint8_t var_count;
3     uint8_t par_count;
4     uint32_t firmware_hash;
5     uint32_t liquid_hash;
6     char device_name[53];
7 } node_info_res_t;
```

Listing 1: NodeInfoRes struct

10.2 Status

General status message with text information.

Field	Bytes	Description
msg	63	Status message text

```
1 typedef struct __attribute__((packed)) {
2     char msg[63];
3 } status_t;
```

Listing 2: Status struct

10.3 FieldRegistration

Registration information for a telemetryValue or parameter field. The DataType here refers to the DataType Enum value (see 10.15).

Field	Bytes	Description
field_id	1	Unique identifier for this field
field_type	1	Data type (DataType enum)
field_name	61	Human-readable field name
Total	63	

```
1 typedef struct __attribute__((packed)) {
2     uint8_t field_id;
3     uint8_t field_type;
4     char field_name[61];
5 } field_registration_t;
```

Listing 3: FieldRegistration struct

10.4 TelemetryGroupDefinition

Defines a group of related telemetryValues for efficient batch updates.

Field	Bytes	Description
group_id	1	Unique identifier for this group
field_ids	62	Array of field IDs in this group
Total	63	

```
1 typedef struct __attribute__((packed)) {
2     uint8_t group_id;
3     uint8_t field_ids[62];
4 } telemetry_group_definition_t;
```

Listing 4: TelemetryGroupDefinition struct

10.5 TelemetryGroupUpdate

Updates all telemetryValues from a previously defined group.

Field	Bytes	Description
group_id	1	Group identifier
values	62	Packed values of all telemetry values in the group
Total	63	

Note: The values are packed in the same order as announced in the TelemetryGroupDefinition.

```
1 typedef struct __attribute__((packed)) {
2     uint8_t group_id;
3     uint8_t values[62];
4 } telemetry_group_update_t;
```

Listing 5: TelemetryGroupUpdate struct

10.6 HeartBeat

Heartbeat message with counter.

Field	Bytes	Description
counter	4	Incrementing counter value

```
1 typedef struct __attribute__((packed)) {  
2     uint32_t counter;  
3 } heartbeat_t;
```

Listing 6: HeartBeat struct

10.7 ParameterSetReq

Request to set a parameter value.

Field	Bytes	Description
parameter_id	1	Parameter identifier
value	61	New value (type depends on parameter)
Total	62	

```
1 typedef struct __attribute__((packed)) {  
2     uint8_t parameter_id;  
3     uint8_t value[61];  
4 } parameter_set_req_t;
```

Listing 7: ParameterSetReq struct

10.8 ParameterSetStatus

Status codes for parameter set operations:

Enum Value	Status Name	Description
0	Success	Parameter was successfully set
1	InvalidParameterID	The parameter ID does not exist
2	ParameterLocked	The parameter is locked and cannot be modified
3	NodeToNodeModification	The parameter was modified by another node

10.9 ParameterSetConfirmation

Response to a parameter set request.

Field	Bytes	Description
parameter_id	1	Parameter identifier
status	1	Status code (ParameterSetStatus enum)
value	61	Confirmed value after set operation
Total	63	

```
1 typedef struct __attribute__((packed)) {  
2     uint8_t parameter_id;  
3     uint8_t status;  
4     uint8_t value[61];  
5 } parameter_set_confirmation_t;
```

Listing 8: ParameterSetConfirmation struct

10.10 FieldGetReq

Request to retrieve a field value

Field	Bytes	Description
field_id	1	Field identifier

```
1 typedef struct __attribute__((packed)) {
2     uint8_t field_id;
3 } field_get_req_t;
```

Listing 9: FieldGetReq struct

10.11 FieldGetRes

Response with requested field value.

Field	Bytes	Description
field_id	1	Field identifier
value	61	Field value
Total	62	

```
1 typedef struct __attribute__((packed)) {
2     uint8_t field_id;
3     uint8_t value[61];
4 } field_get_res_t;
```

Listing 10: FieldGetRes struct

10.12 FieldIDLookupReq

Requests the fieldID of a field matching a field name

Field	Bytes	Description
field_name	61	Field Name
Total	61	

```
1 typedef struct __attribute__((packed)) {
2     uint8_t field_name[61];
3 } field_id_lookup_req_t;
```

Listing 11: FieldIDLookupReq struct

10.13 FieldIDLookupRes

Response with requested field id and the datatype of the field.

Field	Bytes	Description
field_id	1	Field ID
field_type	1	Field Datatype
Total	2	

```

1 typedef struct __attribute__((packed)) {
2     uint8_t fieldID;
3     uint8_t field_type;
4 } field_id_lookup_res_t;

```

Listing 12: FieldIDLookupRes struct

10.14 ParameterSetLock

Locks a parameter to prevent changes.

Field	Bytes	Description
parameter_id	1	Parameter identifier to lock
parameter_lock	1	Lock status(0=unlocked, 1=locked)
Total	2	

```

1 typedef struct __attribute__((packed)) {
2     uint8_t parameter_id;
3     uint8_t lock_status;
4 } parameter_set_lock_t;

```

Listing 13: ParameterSetLock struct

10.15 DataType

The protocol supports the following data types:

Enum Values	Type Name	Description
0	Float32	32-bit floating point
1	Int32	32-bit signed integer
2	Int16	16-bit signed integer
3	Int8	8-bit signed integer
4	UInt32	32-bit unsigned integer
5	UInt16	16-bit unsigned integer
6	UInt8	8-bit unsigned integer
7	Boolean	8-bit value: non 0 value equals true

11 Versioning and Extension Mechanisms

This protocol uses semantic versioning. See <https://semver.org/> for a detailed description. A minor update version would, for example, be adding a new datatype or a new message type. Every update of the document must trigger an update of the liquidCAN repo, containing the Rust and C code for each implementation. The updated repo must be reflected in the `liquidcan_hash` field of the `node_info_announcement` used in the firmware/server.

The Firmware in the system can run with minor or patch version differences, "major" changes are not allowed to run simultaneously. The server can inform the operators in case there is firmware running with different major versions.
